

Data Flow Diagram (DFD)

Date: 8/07/2026
Team Members: C. Lokesh, G. Sankar
Project: Personalized Networking Assistant

DFD Description

The following Level-0 Data Flow Diagram describes how information travels between the user, application services, and local storage within the Personalized Networking Assistant.

Component	Description
External Entity	User submits event details, professional role, and interests.
Process 1	Analyze event context using semantic embeddings.
Process 2	Generate personalized networking conversation starters.
Process 3	Verify selected topics using Wikipedia knowledge.
Process 4	Store conversation history and user feedback.
Data Store	History.json and Feedback.json retain session records.
Output	Conversation guide, verified facts, and saved session history.

Data Flow Summary

User inputs are processed by the event analysis module, followed by AI-based topic generation and fact verification. The generated responses and feedback are then stored for future reference and continuous improvement.
